

Cold atmospheric argon plasma significantly decreases bacterial load of chronic infected wounds in patients

Dr. Georg Isbary

Plasma Project – From medical point of view

- **Importance of the plasma project**
- In vitro proof of principle experiments
- Phase II study – results

Chronic wounds are a major burden for the health system

- **Prevalence ~ 1-2 % in German Population (> 1.000.000 patients)**
- **High costs for the community 1-2 % of annual health care budget***
- **Venous ulcers require an average of 24 weeks to heal, 15% never heal, recurrence is found once or multiple times in 15-71% of cases** *****

*Etofugh CN, Phillips TJ. Venous ulcers. *Clin Dermatol* 2007; **25**: 121-30.

**Kurz et al. VEINES Task Force Report, *Int Angiol.* 1999;18(2):83-102.

***Heit et al. Venous thromboembolism epidemiology *Semin Thromb Hemost.* 2002;28(suppl 2):3-13

Big Issue – Increasing rate of resistance/ multiresistance

- „Bacteria can become resistant to antibiotics“ warned Alexander Fleming, when he landed the Nobel prize in Medicine in 1945.
- European Antimicrobial Resistance Surveillance System (EARSS) 2007: Resistance is becoming a larger problem year after year (especially for *Streptococcus pneumoniae*, *Staphylococcus aureus*, *Enterococcus faecalis*, *Enterococcus faecium*, *Escherichia Coli*, *Klebsiella pneumoniae* and *Pseudomonas aeruginosa*)
- Global Health Care Associations consider multiresistant germs like MRSA as a global threat*
- Worrying is the raising resistance against so called reserve drugs within the last 6 years – e.g. Vancomycin (EARSS 2007)
- „Gold standard“ Vancomycin with failure rates of 23-52%!)
- Antimicrobial drug-resistant infections do increase death, illness, and direct costs by 30-100%****
-

*Grundmann H, Aires-de-Sousa M, Boyce J et al. Emergence and resurgence of methicillin-resistant *Staphylococcus aureus* as a public-health threat. *Lancet* 2006; **368**: 874-85.

Big Issue – Increasing rate of resistance/ multiresistance

- Infections with MRSA kill ~19000 hospitalized patients in the U.S. annually (similar to the number of deaths caused by AIDS, tuberculosis and viral hepatitis combined!)**
- In 2006, on any given day >23k pts were hospitalized in the US with MRSA infection***
- Antimicrobial drug-resistant infections do increase death, illness, and direct costs by 30-100%****

Klebens RM, Morrison MA, Nadle J et al. Invasive methicillin-resistant *Staphylococcus aureus* infections in the United States. *Jama* 2007; **298: 1763-71

***Jarvis, CID Jan 15, 2010

****Cosgrove SE, Carmeli Y. The impact of antimicrobial resistance on health and economic outcomes. *Clin Infect Dis* 2003; **36**: 1433-7.

Side effects of antibiotics

- ~10% of hospitalized patients present an allergy against penicillin (but only 10% of those actually have allergic reactions during treatment)*
- Problematic is the cross-reactivity, which averts the use of many other antibiotics, e.g. cephalosporins*

- Antibiotic associated diarrhea occurs in about 5-30% during therapy or even two month after ending the treatment**, ***

*Greenberger PA. Drug allergy. Part B: Allergic reactions to individual drugs: low molecular weight. *Patterson's Allergic Diseases* 2002: 335-59

McFarland LV. Epidemiology, risk factors and treatments for antibiotic-associated diarrhea. *Dig Dis* 1998; **16: 292-307

***Wistrom J, Norrby SR, Myhre EB et al. Frequency of antibiotic-associated diarrhoea in 2462 antibiotic-treated hospitalized patients: a prospective study. *J Antimicrob Chemother* 2001; **47**: 43-50

New antibiotic drugs

- Genomic derived or target based antibiotics need a lot of time to brought to the market:
 - for gram + strains ~ 2012*
 - for gram – strains ~ 2016 - 2021*

*Payne DJ, Gwynn MN, Holmes DJ et al. Drugs for bad bugs: confronting the challenges of antibacterial discovery. *Nat Rev Drug Discov* 2007; **6**: 29-40

Deadly Germs Largely Ignored By Drug Firms

By ANDREW POLLACK
Published: February 26, 2010

Gram-negative bacteria are practically built to withstand drugs, which is one reason few drug makers have rushed to pursue treatments.

Related

[Rising Threat of Infections Unfazed by Antibiotics](#)
(February 27, 2010)

The bacteria have a double cell membrane to shield them, compared with Gram-positive organisms, which have a single membrane. They can make various enzymes that break down antibiotics. And some,

particularly *Pseudomonas aeruginosa*, have powerful pumps that can expel the drugs.

The bacteria also readily exchange genes, even across different species, that confer drug resistance.

It is likely to be several years before new drugs to treat Gram-negative infections are available. A report last September by European health authorities found only six novel drugs in clinical trials that might work against at least one Gram-negative organism, compared with 13 for Gram-positive bacteria.

A separate study released about a year ago by the Infectious Diseases Society of America found no drugs in middle- or late-stage clinical trials directed specifically at Gram-negative organisms. There were eight drugs in those trials that developers hoped might work against both Gram-negative and Gram-positive microbes.

The difficulty of killing Gram-negative germs is not the only reason for the dearth of new

Cold atmospheric plasmas are ideal antibiotics

reactive species (O_3 , NO, NO_2 , N, O, OH,.....)

charged particles (electrons, positive/negative ions)

light (UV, visible and IR)

electric field

heat

Benefits of our indirect low temperature Argon plasma

Low temperature argon plasma:

- Allows in-vivo application, without damaging tissue
- Medical cocktail – can be tuned for different purposes
- Contact free application, reaches “rough” surfaces down to micrometer scale
- Bactericidal (fungicidal and virucidal)
- Physical-therapy → Resistance and allergic reactions are less feasible
- Enhanced wound healing

Plasma Project – From medical point of view

MRSA before and after plasma treatment

MRSA before and after control

PSAE changes before and after plasma treatment

PSAE changes before and after control

Phase II study up to now – MicroPlaSter alpha

- 1600 treatments (1 to 169, in average 9,1 per patient)
- 166 patients

- diagnosis: mostly infected ulcers of the lower leg

Interim analysis (efficacy of plasma treatment)

- 36 patients
- 291 treatments
- 5 min treatment time

- Primary aetiology of wounds: venous ulcers (47%)

- Filter taken before and after treatment

Results: 5 min treatment time

Highly significant ($p < 10^{-6}$) higher germ reduction (34%) in plasma treated area

Summary of Phase II - Results 5min of treatment time

Results from the corresponding bootstrap-test

KEYWORDS
plasma medicine • cold atmospheric plasma • argon plasma • infection • chronic wounds • MRSA

ABSTRACT
Background: Bacterial colonization of chronic wounds slows healing. Cold atmospheric plasma has been shown in vitro to kill a wide range of pathogenic bacteria.
Objectives: The safety and efficiency of cold atmospheric argon plasma to decrease bacterial load as a new medical treatment for chronic wounds.

PMID: 20222930

Interim analysis (efficacy of plasma treatment)

- 14 patients
- 70 treatments
- 2 min treatment time

- Filter taken before and after treatment

UV effect on bacteria (E. coli)

without quartz glass

1min

2min

with quartz glass

2min

UV-measurements of MicroPlaSter

UV-spectrum of the argon plasma. Control of reactive species and UV radiation:
 UVA : N₂ molecules
 UVB: OH
 UVC: NO

Measurements of reactive species in air revealed:
 NO: < 1 ppm
 NO₂: ~ 6 ppm at max
 O₃: ~ 900 ppb

- The total integrated erythemal-weighted irradiance is:
 $\Sigma P_{\text{eff}}(\lambda) \times \Delta\lambda = 9.3 \mu\text{W}/\text{cm}^2 = 0.09 \text{ W}/\text{m}^2$
- Maximum allowed dose = $0.30 \text{ W}/\text{m}^2$
 (WHO guidelines – ICNIRP)

Recommendations for open wounds or unprotected skin (SCCP {European Commission} Report 0949/05)

- For **open wounds or unprotected skin** we used a modified erythema action spectrum to calculate the total erythema weighted irradiance:
- $\Sigma P_{\text{eff}}(\lambda) \times \Delta\lambda = 21.1 \mu\text{W}/\text{cm}^2 = 0.21 \text{ W}/\text{m}^2 < 0.3 \text{ W}/\text{m}^2$

Optical emission spectra of UV radiation produced by the MicroPlaSter and the sun

UV Power ($\mu\text{W}/\text{cm}^2$)

	UVC	UVB	UVA
Sun	1-2.5	30-50	~600
MicroPlaSter	10-16	40-60	<100

microwave power 60W, main (Ar) gas flow rate 1300sccm, z 20mm

1 min of MicroPlaSter treatment gives the same UVC dose as 5 min sunlight. For UVB 1 min of treatment is equivalent to 1 min solar exposure. For UVA 1 min of treatment corresponds to 10 s of sun exposure.
(Steffes B., Shimizu T. et al. 2008, 2009)

Background of treatment time reduction: UV-measurements of argon plasma

- There are no regulations and studies about long-term effects of plasma treatment
- We do produce UV, and to some parts UVC as well, which is known to be carcinogenic

To have a „safe“ distance to the aforementioned limits/ recommendations we decided to reduce treatment time to 2 min

Results: 2 min treatment time

Significant ($p < 0.016$) higher germ reduction (40%)
in plasma treated area

Summary of Phase II - Results 2min of treatment time

Results from the corresponding bootstrap-test

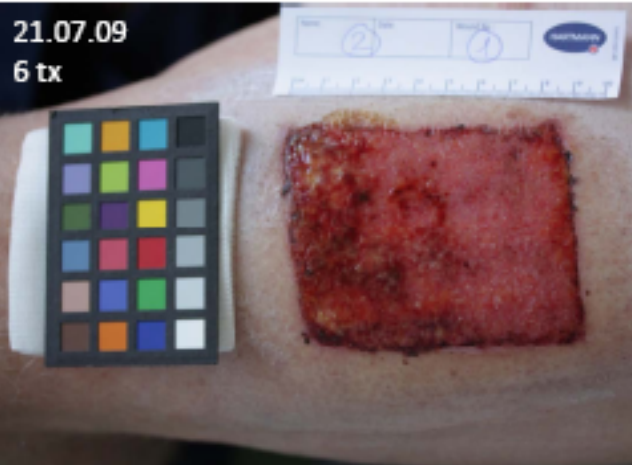

Faster wound healing due to plasma therapy?

Very difficult part to measure/evaluate the wound size and changes

Data in progress, BUT:

Possible faster wound healing due to first „impressions“ of an interim analysis with mesh grafts

Keratinocytes: induce VEGF
Fibroblasts: induce inhibits
induces VEGF
reduc

F-GF, GM-CSF,
4
(treatment time)
(treatment time)
MMP1,

Results

- A highly significant (34%, $p < 10^{-6}$) higher germ reduction in 5 min plasma treated area vs. control area
- A significant (40%, $p = 0.016$) higher germ reduction in 2 min plasma treated area vs. control area
- No side effects occurred until now, and the treatment is well tolerated
- The use of nitrocellulosis filters revealed a higher accuracy and reproducibility than common swab techniques

Media attention

The image shows a screenshot of a news article from The New York Times Business section. The article is titled "Hospital-Clean Hands, Without All the Scrubbing" by Anne Eisenberg, published on February 13, 2010. The article discusses a prototype hand sanitizer that uses plasma technology to clean hands in just four seconds, reducing the need for traditional scrubbing. It mentions that the technology is being developed in several laboratories, including the Max Planck Institute for Extraterrestrial Physics in Garching, Germany.

The screenshot includes the BBC News logo, navigation menus for various news categories, and a sidebar with related content. The main article text is as follows:

NOVELTIES
Hospital-Clean Hands, Without All the Scrubbing
 By ANNE EISENBERG
 Published: February 13, 2010

HOSPITAL workers often have to wash their hands dozens of times a day — and may need a minute or more to do the process right, by scrubbing with soap and water. But new devices could reduce the task to just four seconds, cleaning even hard-to-reach areas under fingernails.

Enlarge This Image
 Instead of scrubbing, the workers would put their hands into a small box that bathes them with plasma — the same sort of luminous gas found in neon signs, fluorescent tubes and TV displays. This plasma, though, is at room temperature and pressure, and is engineered to zap germs, including the drug-resistant supergerm [MRSA](#).

Enlarge This Image
 The technology is being developed in several laboratories. Gregor Morfill, who created several prototypes using the technology at the Max Planck Institute for Extraterrestrial Physics in Garching, Germany, says the plasma quickly
